

## Linx IJ600 Printer Driver v1.0

### Product description

The Linx IJ600 Printer Driver is a utility that allows a user to download and print a message created within a PC-based Windows application. The application would typically be a label design program although for relatively simple graphic creation Microsoft Word for Windows may prove sufficient.

### Key benefits

- Creation of more complex messages for the IJ600 on a PC
- Exploit the full power of a label design program
- Incorporate printer message fields in messages designed on a PC (application dependent)
- Existing label design software can be used
- Smooth transition from printing labels to direct coding on outer case or paper sack

### Typical applications

- Message creation and backup in label design and other programs
- Message download from label design and other programs
- Centralised or remote creation of messages for a network of printers
- Interfacing the message creation process to a host system or external database

**Links IJ600 to PC-based Windows applications**

**Uses standard Windows printer interface**

**Enables message creation and download from a PC**

**Still uses printer message fields for added flexibility (application dependent)**

The IJ600 Printer Driver enables the IJ600 to be treated like a normal Windows printer in any Windows application. Messages can be created using a label design program and output directly to the IJ600. More complex messages can be created and backed up on a PC, thus exploiting the full power of modern label design programs with features such as database connectivity and interfaces to host systems.

While creating the message in a label design program the user may still have access to all the underlying printer message field functions - date fields with date offsets, time fields, sequential number fields, fields for remote data and bar codes – and the printer's own fonts\*. On printing, these fields are generated by the IJ600 rather than downloaded as graphics and can be edited on the printer itself if required. Fields can also be updated automatically by the printer as required, without the need to download the message again.

The IJ600 Printer Driver also monitors the status of the printer but does not act as a full control and diagnostic interface.

\*The Linx IJ600 Printer Driver has been tested with leading label design programs and Linx can provide advice on relative performance and availability of the printer functions. Some label design programs offer restricted access to the printer functions.

## Product details

The Driver is supplied on a CD which includes:

- An Installation Guide
- Linx IJ600 Printer Driver – the driver is self-installing and comes with extensive on-screen Help files to explain all of its functions.
- An Application Manual which provides full information on how to use the Driver with major label design programs
- User registration information – registered users will be able to contact Linx for technical support on the use of the Driver.

## Minimum requirements

### PC

- Pentium II 233 MHz running one of:
  - Windows 2000 (Service Pack 3 or above)
  - Windows XP
- 64 MB of RAM
- CD-ROM drive
- One or more RS232 COM ports (one port is required for each Linx printer to be connected)

### Printer

- Any IJ600 running v1.02 (or later) system software
